[57] **ABSTRACT**

A bandage composition especially suitable for application from aerosol containers onto wound surfaces. These compositions comprise $A_x B_y A_z$ block polymers wherein the A_x and A_z blocks are a non-elastomeric polymers and the B_y block is an elastomeric polymer, together with solvents for the block polymers and propellants. The composition may also include local anesthetics and antibiotic or antiseptic agents. When applied to a wound surface, an opaque adherent flexible fibril mat, which is breathable to air, yet is largely occlusive to liquids is formed.
